especially explosives comprises small molecules, Apparatus for detecting a piezoelectric crystal

90pp; English 3В; Disclosure; Fig The present sequence is the light chain variable region of 5B3 antibody. The cDNA encoding this sequence was obtained from total RNA extracted from a 5B3 hybridoma by RT-PCR. 5B3 is an IgG1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for detecting small assayed explosive molecules. Molecules are detected using a piezoelectric sensor. Piezoelectric immunoassaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight molecules

The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of therapeutics with a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the partial amino acid sequence of the mouse anti-cryptic collagen site antibody HUIV26 variable region light chain used during the creation of the antibody of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a composition that contains a bispecific single chain antibody consisting of at least two domains, where one of domains binds to human cell adhesion molecule (EpCAM) antigen, and the second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment or amelioration of a tumorous disease, such as an epithelial or minimal residual cancer. The present amino acid sequence represents an antibody light chain variable domain that is specific for human EpCAM.

The invention relates to a cytotoxically active CD3 specific binding construct an Ig-derived second binding domain. The CD3 specific binding construct above or the construct produced by the process, nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host diseases, or host-versus-graft diseases. The cytotoxically active CD3 specific binding construct is useful for treating, preventing, or ameliorating proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, viral disease,

The invention relates to a method of identifying binding site domains (BSD) that retain the capacity of binding to a predetermined epitope when positioned C-terminal of at least one further domain in a recombinant bion positioned C-terminal of at least one further domain in a recombinant bion positioned C-terminal of a biological display system as part of a fusion protein for binding to a predetermined epitope, where the fusion protein comprises an additional domain positioned N-terminal of the BSD and an amino acid sequence that mediates anchoring of the fusion protein to the surface of the display system; and (b) identifying a BSD that binds to the predetermined epitope. The method is useful to identify bion or multivalent polypeptides that comprise antibody binding sites capable of efficiently binding to the corresponding antigen. The polypeptides or antibodies identified by the method are useful therapeutically and diagnostically, for e.g. cancer and autoimmune diseases. ScFv-antibody fragments that bind independently of their position within bifunctional single-chain fusion proteins can be isolated from combinatorial antibody libraries using the new in vitro method. The invention comprises a composition that contains a bisp chain antibody consisting of at least two domains, where o binds to human epithelial cell adhesion molecule (EpCAM) a second domain binds to human CD3 antigen. The bispecific a construct of the invention is useful for the prevention, tamelioration of a tumorous disease, such as an epithelial residual cancer. The present amino acid sequence represent single chain antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                  pharmaceutical composition having a bis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a cytotoxically active CD3 specific binding construct comprises a first domain specifically binding to human CD3 and and generated second binding domain. The CD3 specific binding construct above or the construct produced by the process, nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an infectious disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host diseases, or host-versus-graft disease. The cytotoxically active CD3 specific binding construct is useful for treating, preventing, or ameliorating proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an inflammatory disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host diseases, or host-versus-graft diseases. The present sequence represents the amino caid sequence of a CD3 specific binding construct.
                                                                                                                                                                                                                                                                                                                                                                             a first

                                                                                                                                                                                                                                                                                                                                                                                                                                             molecule;
                                                                                                                                                                         chain antibody consisting of at least two domains, where one of dom binds to human epithelial cell adhesion molecule (EpCAM) antigen, second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment amelioration of a tumorous disease, such as an epithelial or minima residual cancer. The present amino acid sequence represents a bispesingle chain antibody of the invention.

                                                                                               The invention comprises a composition that contains a bispecific sichain antibody consisting of at least two domains, where one of dom binds to human epithelial cell adhesion molecule (EpCAM) antigen, a second domain binds to human CD3 antigen. The bispecific antibody construct of the invention is useful for the prevention, treatment amelioration of a tumorous disease, such as an epithelial or minima residual cancer. The present amino acid sequence represents a bispesingle chain antibody of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              binding construct comprises 1D3 and an Ig-derived second 1g, or ameliorating, e.g.
    chain
                                                                                                                                                                                                                                                                                                                                                                                                                             ö
 New pharmaceutical composition having a bispecific single c
construct, useful for preventing, treating or ameliorating
disease, such as an epithelial or minimal residual cancer.
                                                                                                                                                                                                                                                                                          503
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ပဲ

The invention relates to a cytotoxically active CD3 specific binding construct comprises a first domain specifically binding to human CD3 and an Ig-derived second binding domain. The CD3 specific binding construct above or the construct produced by the process, nucleic acid molecule, vector, or host is useful for the preparation of a pharmaceutical composition for the prevention, treatment, or amelioration of a proliferative disease, a tumor, an inflammatory disease, an immunological disorder, an autoimmune disease, an infectious disease, viral disease, allergic reactions, parasitic reactions, graft-versus-host diseases, or host-versus-graft diseases. The cytotoxically active CD3 specific binding construct is useful for treating, preventing, or ameliorating

antibody pharmaceutical composition having a bispecific single chain antibortruct, useful for preventing, treating or ameliorating a tumorous sase, such as an epithelial or minimal residual cancer. construct, disease, Ze Z

English. Claim 12; SEQ ID NO 39; 227pp;

composition that contains a bispecific single of at least two domains, where one of domains cell adhesion molecule (EpCAM) antigen, and the The invention comprises a chain antibody consisting binds to human epithelial

```
This invention relates to sialoadhesin factor-1 (SAF-1) monoclonal antibodies 13G3 and 11G4. A neutrophil-priming dose of SAF-1 agonist antibodies 13G3 and 11G4. A neutrophil-priming dose of SAF-1 agonist cantibody or a pharmaceutical composition comprising the antibody is useful for treating or preventing an infectious disease state such as costeomyelitis, deep seated wound infections, sepsis, antibiotic resistant bathogens and parasites such as Listeria monocytogenes, Salmonella and cathogens and parasites such as Listeria monocytogenes, Salmonella and Leishmania in a mammal. Nucleic acid sequences encoding the variable introduction of specific changes within the nucleic acid sequences introduction of the resulting modified or fusion regions, and for incorporation of the resulting modified or fusion capins acid sequence into a plasmid for expression. The CDR-encoding cregions comprising silent mutations are used in construction of humanized

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The amino acid sequences of the light and heavy chains of the variable domains from antibodies HYH [HYHEL-10 Fab-lysosyme complex] [AAR38601 and AAR38609-10, MCPC [IGA Fab MCPC603-phosphocholine complex] (AAR38602-03 and AAR38609-10, respectively), NEWM [Ig Fab' NEW] (AAR38604-05 and AAR38611, respectively) and KOL [IgG1 KOL] (AAR38606-07 and AAR38612, respectively) may be used to determine an alignment from which appropriate changes may be made. Unlike other methods of humanisation, which advocate the replacement of entire antibody framework regions with those of human antibodies, this method involves only the introduction of human residues into those positions not critical for antigen binding. This ensures that the binding properties of the modified antibody are not diminished. (Updated on 25-MAR-2003 to correct PN field.)

AAW58480), and (b) a modified heavy chain variable region (see AAW58479 or AAW58481), where AAW58478 and AAW58479 are humanised forms of the H65 light and heavy chain variable domains with low risk amino acid substitutions [i.e. low risk of reducing antigen-binding specificity.] and AAW58480 and AAW58481 are humanised forms of the H65 light and heavy chain variable domains with moderate risk amino acid substitutions and are present in humanised H65 antibody he3 (ATCC HB 11206). The method is useful for treating autoimmune diseases, especially systemic lupus erythematosus, rheumatoid arthritis, psoriasis or type I diabetes. The present sequence represents the murine MCPC antibody light chain variable

G30535
Ig kappa chain V region (2G6) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 23-Feb-1989 #sequence_revision 23-Feb-1989 #text_change 21-Jar
C;Accession: G30535
R;Claflin, J.L.; Berry, J.; Flaherty, D.; Dunnick, W.
J. Immunol. 138, 3060-3068, 1987
A;Title: Somatic evolution of diversity among anti-phosphocholine antiA; Reference number: A30556; MUID:87196439; PMID:3106498
A;Accession: G30535
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-107 < CLA>
A;Coss-references: UNIPARC:UPI0000176AF6
A;Note: the sequence was determined from the differentiated gene
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;16-96/Domain: immunoglobulin homology <IMM>

### November 2005

Published\_Applications Nucleic Acid and Published\_Applications Amino Acid database searches now generate two sets of results each. The Published\_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published\_Applications\_New databases; older published applications make up the Published\_Applications\_Main databases.

Searches run against Nucleic Acid Published\_Applications produce two sets of results, with the extensions <code>.rnpbm</code> (Published\_Applications\_NA\_Nain) and <code>.rnpbn</code> (Published\_Applications\_NA\_New).

Searches run against Amino Acid Published\_Applications produce two sets of results, with the extensions <code>.rapbm</code> (Published\_Applications\_AA\_New).

Biochem. J. 171:337-347(1978).

-!- MISCELLANEOUS: The mature chain has 12 additional residues at amino end, due to a tandem duplication of 36 nucleotides after codon for residue 36. Residue 42 corresponds to the N-terminal residue of typical kappa chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NUCLEOTIDE SEQUENCE [GENOMIC DNA] OF 41-149.

MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/077,252B
FILING DATE: 14-JUN-1993
CLASSIFICATION: 424
ATTORNEY/AGENT INFORMATION:
NAME: Weber, Ellen Lauver
REGISTRATION NUMBER: 15280-152
REFERENCE/DOCKET NUMBER: 15280-152
REFERENCE/DOCKET NUMBER: 15280-152
TELEPHONE: (415) 576-0300
INFORMATION FOR SEQ ID NO: 4:
SEQUENCE CHARACTERISTICS:
LENGTH: 113 amino acid
TYPE: amino acid
